Tumbleweed

Rock & Roll

openSUSE Tumbleweed

- Built correctly
- Tested well
- Delivered quickly
- Trusted more and more

Built correctly

- Built together as a cohesive distribution
- If a new package checked in that potentially can invalidate another package, then the dependant packages are rebuilt.
- Traditional distributions take days, we do it in hours
- Open Build Service (<http://build.opensuse.org/>)
- This produces a 'snapshot'. Traditional distribution call this a 'release candidate'.
- Tumbleweed does it about 5 times a week

Tested Well

- But building is only half the story. A good distribution needs to be tested.
- Arch and Gentoo rely on manual testers.
- openSUSE has openQA
- Before any human, openQA tests that snapshot over 100 times across four different hardware architectures (i586, x86_64, ppc64, and aarch64)
- openQA actually does proper real-world scenarios. Installations, upgrades, dual booting, encrypted LVM, kde, gnome, xfce, live CD's, network installs.

Tested Well

openQA results

Test	x86_64
RAID0	
RAID1	
RAID10	
RAID5	
awesome	
boot_to_snapshot	
cryptlvm	
cryptlvm@uefi	
dual_windows8	
ext4	
extra_tests_on_gnome	 multi_users_dm
extra_tests_on_kde	 multi_users_dm

Tested Well

- So every test checks that every screen looks the way we want it to look for users.
- Every function that is tested presses the same keys and clicks on the same mouse buttons that a user would, and then openQA confirms that piece of software behaves in the way it has been taught to expect.
- openQA does this for every step in installations & upgrades.

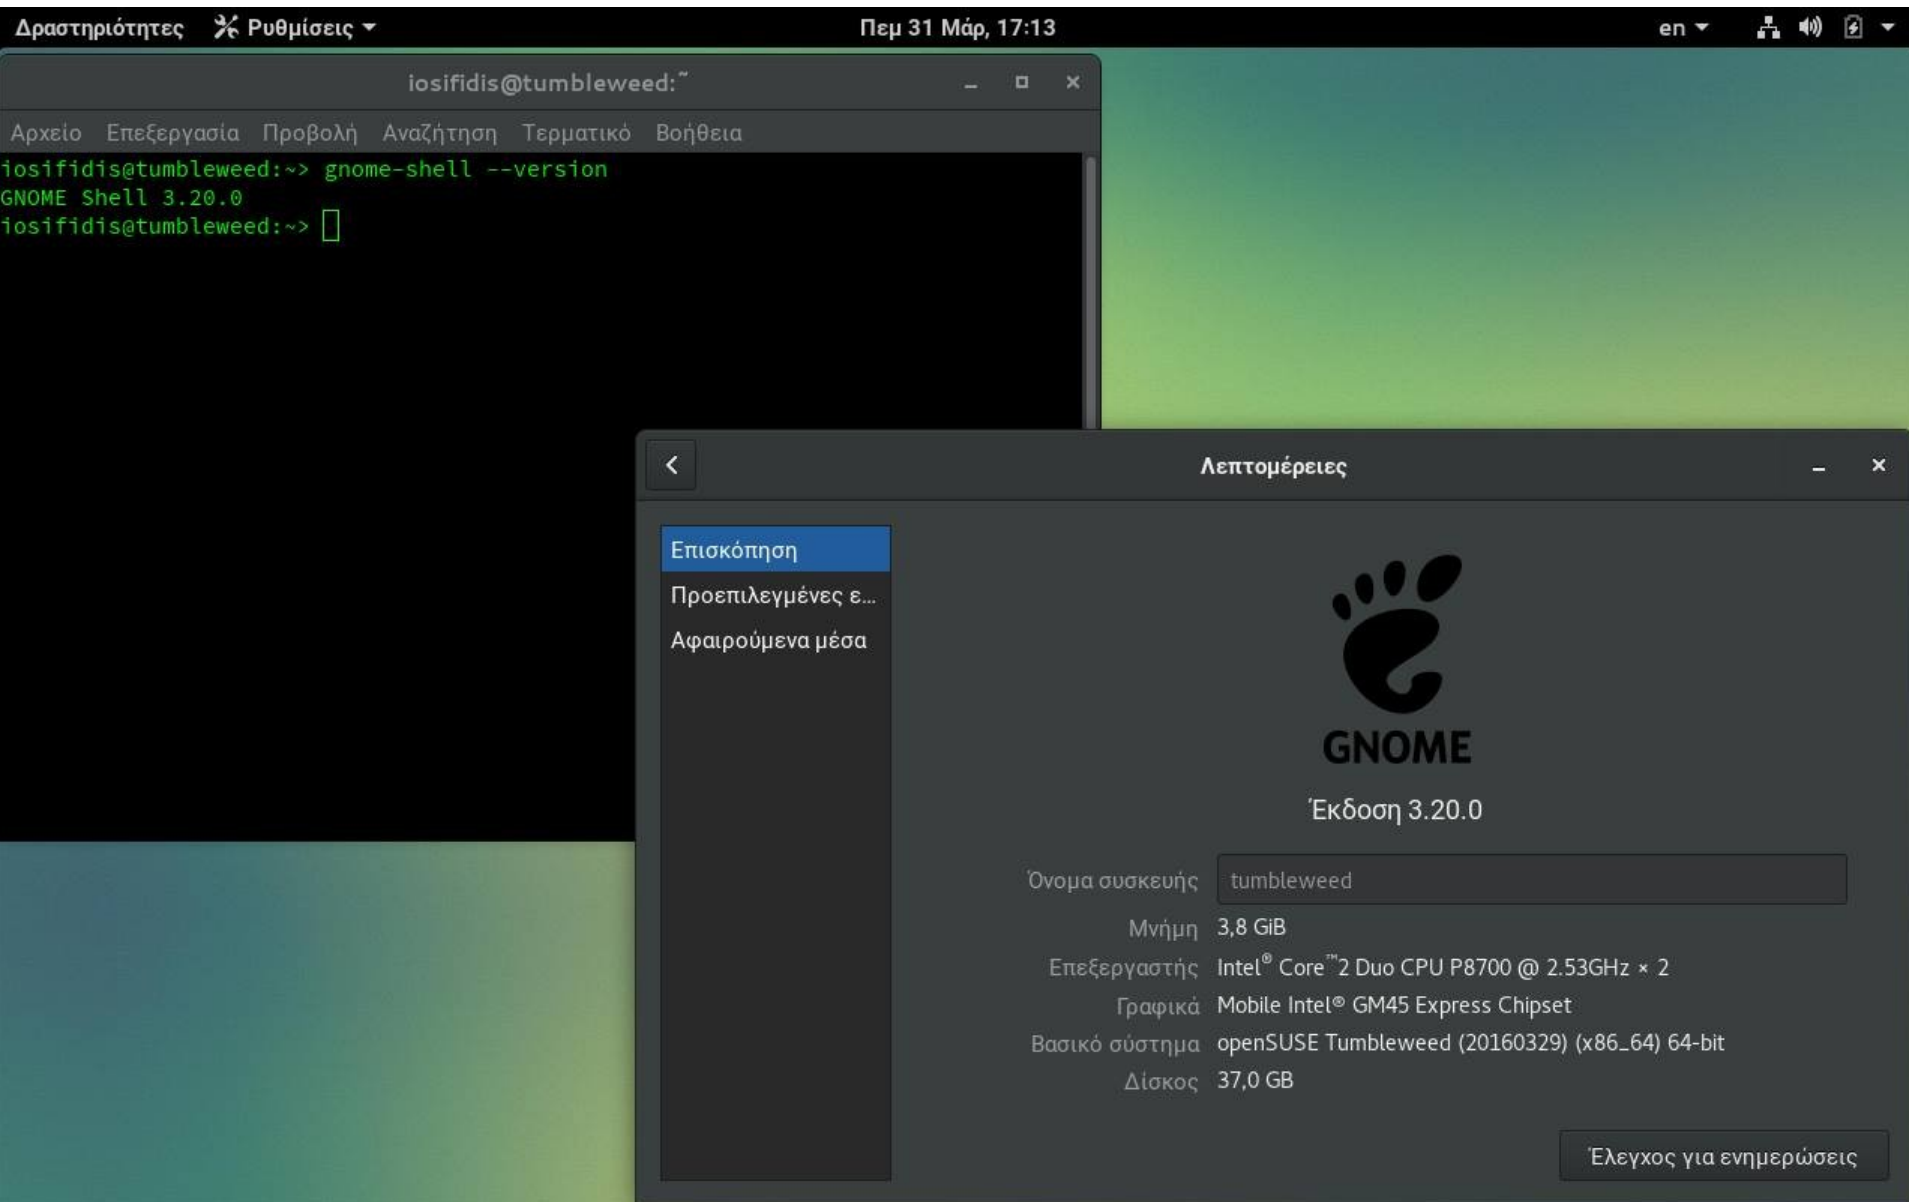

Tested Well

- We even do extra testing on incoming package submissions, so many cases we catch things before they get anywhere near a snapshot, and our developers get nice fast feedback about their otherwise potentially destructive change.
- Yes, we have implemented Continuous Integration for distributions, and if you were using OBS and openQA you could be doing it too.
- <https://openqa.opensuse.org/>

Delivered Quickly

- 1000's of tests, over 100 scenarios...and with our current hardware (thanks SUSE!) a full snapshot gets tested in about 3 hours.
- And IF IT PASSES, it ships, automatically.
- And a 'quiet' week can consist of approx new/updated 150 packages and a new kernel...
- A normal week is double, if not triple that, and it's moving faster and faster...

GNOME
Έκδοση 3.20.0

Όνομα συσκευής openSUSE
Μνήμη 3,8 GiB
Επεξεργαστής Intel® Core™2 Duo CPU P8700 @ 2.53GHz × 2
Γραφικά Mobile Intel® GM45 Express Chipset
Βασικό σύστημα Arch Linux 64-bit
Δίσκος 116,4 GB

Delivered Quickly

- That's not universally true though, good testing finds bugs, those bugs need to be fixed, so if you ever notice something taking longer than you'd like, it's often a sign that we could do with more contributors helping Package that particular software.
- You can contribute to Tumbleweed even as end user.

Trusted by More and More

Trusted by More and More

- If public numbers are to be believed Tumbleweed might already be larger than ‘more famous’ rolling distributions. Whether or not that’s true doesn’t change one fact - We want YOU to try Tumbleweed.
- Companies like SoftIron who ship Tumbleweed on their Overdrive 3000 64-bit ARM servers, and Fujitsu who offer Tumbleweed as their chosen community Linux to customers with Skylake hardware.
- If you care about Linux, you want the latest packages, but you only want them when they actually work, Tumbleweed is the best choice.
